

Safe Patients Smart Hospitals

What Can Diagnostic Errors Learn  
from Reducing CLABSI

Peter Pronovost, MD, PhD, FCCM  
Johns Hopkins University

---

Please answer each question with a score of 1 (below average) to 5 (above average).

- How smart am I
- How hard do I work
- How kind am I
- How tall am I
- How good is the quality of care we provide

### Types of Quality and Safety Problems

- Putting evidence into practice
- Learning from mistakes at local and system levels
- Improving teamwork and communication
- Reducing diagnostic errors
- Improving value (quality/cost)
- Reducing disparities

### Improving Care

CUSP	Translating Evidence Into Practice (TRIP)
1. Educate staff on science of safety	1. Summarize the evidence in a checklist
2. Identify defects	2. Identify local barriers to implementation
3. Assign executive to adopt unit	3. Measure performance
4. Learn from one defect per quarter	4. Ensure all patients get the evidence <ul style="list-style-type: none"><li>• Engage</li><li>• Educate</li><li>• Execute</li><li>• Evaluate</li></ul>
5. Implement teamwork tools

## Strategies for Adaptive Work

- Clarify what hill you will climb and invite others to determine how to climb it
- Surface real and perceived loss- the flip
- Eliminate monsters in the bathroom
- Tune into WIFM- Pepperoni Pizza
- Keep the temp pressure in the pressure cooker just right: not too hot and not too cold
- Have authentic conversations, value the dissenter

### Optimizing Patient Outcomes A National Model

- Align efforts toward common purpose when:
  - Evidence to improve outcomes
  - Valid measure
  - Pilot project demonstrates improvement
- Management Levers
  - National roll out of Hopkins Program with HRET, MHA, JHU
  - Professionalism
- Social Pressure Levers
  - Public reporting, Consumers Union, Leapfrog, Media
- Economic Levers
- Regulatory Levers

---

---

---

---

---

---

### How Does this Apply to Diagnostic Errors

QUALITY AND SAFETY RESEARCH GROUP      

---

---

---

---

---

---

---

---

## Why Do Diagnostic Errors not get Attention

- Technical Problems
  - No national estimate of the magnitude of harm
  - No taxonomy or process to map diagnostic process
  - Lack of interdisciplinary teams
- Adaptive Problems
  - Lack of public dialogue about accuracy of diagnostic tests, risk thresholds and who pays

## A Diagnostic Error Story

QUALITY AND SAFETY RESEARCH GROUP      Slide 17     

---

---

---

---

---

---

---

---

## Process for Medication Errors

- Unknown, but highly variable, environment-specific, and patient-dependent

Table 1 Counts and percentage of errors in each medication error domain before and after expert review and reconciliation

	Before expert review		After expert review	
	N	%	N	%
Prescribing errors	298	30%	262	29%
Dispensing errors	245	24%	223	25%
Administering errors	410	41%	345	38%
Documentation errors	57	6%	69	8%
<b>Total</b>	<b>1010</b>		<b>899</b>

## Lessons from Ants and Bees

**The Economist**  
Artificial intelligence  
**Riders on a swarm**  
Mimicking the behaviour of ants, bees and birds started as a poor man's version of artificial intelligence. It may, though, be the key to the real thing

## What Test to Order

QUALITY AND SAFETY RESEARCH GROUP    JOHN HOPKINS

---

---

---

---

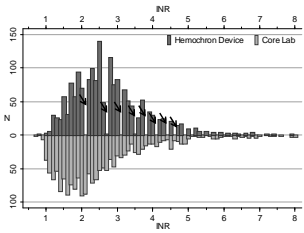

---

---

---

---

### Example of Testing Device Errors - POC INR Devices

Device	INR Value	Frequency
Core Lab	1	10
	2	25
	3	45
	4	65
	5	85
	6	100
	7	80
	8	50
	9	20
	10	10
Hemochron Device	1	10
	2	25
	3	45
	4	65
	5	85
	6	100
	7	80
	8	50
	9	20
	10	10

- POC INR device simply never reports seven commonly occurring IR values (blue arrows).
- It leads clinicians to the wrong clinical decision in about one out of every three measures (30%).
- Clinicians typically make no change when a dose increase would be suggested by the lab measure as a result of the testing device error.

---

---

---

---

---

---

---

**End-Digit Preference and the Quality of Blood Pressure Monitoring in Diabetic Adults**

• Tight BP control reduces diabetes-related cardiovascular risk

• Low quality BP data, reflected in end-digit preference (EDP), is common:

- Taken by non-physicians - 4,333 BPs: 50% of systolic, 50% of diastolic readings ended in zero
- Taken by physicians - 1,347 BPs: 69% of systolic, 64% of diastolic readings ended in zero

• Rounding down can result in under-diagnosis and under-treatment

QUALITY AND SAFETY RESEARCH GROUP Slide 25 JOHNS HOPKINS

---

---

---

---

---

---

---

---

### Failure to follow up errors

• Patient notification and follow-up of abnormal test results: A physician survey (Bookhaker, et al) → Found that up to 33% of physicians did not always notify patients about abnormal test results.

• Patient safety concerns arising from test results that return after hospital discharge (Roy, et al) → Of the discharges surveyed, 9.4% of the patients with test results return after discharge were potentially actionable.

QUALITY AND SAFETY RESEARCH GROUP Slide 26 JOHNS HOPKINS

---

---

---

---

---

---

---

---

### Cycle of diagnosis

• Be mindful of cognitive errors

- 2<sup>nd</sup> opinion
- Consultation
- Team input

Formulate differential diagnosis

Select correct follow-up tests

- 2<sup>nd</sup> opinion
- Consultation
- Team input
- Checklist

Perform and interpret test correctly

- Be mindful of test limits, device errors
- Checklist
- 2<sup>nd</sup> opinion

Select appropriate treatment(s) and/or follow-up

- Computerized decision support
- Checklist

**MALPRACTICE & ERRORS**

By Emily R. Carrier, James D. Reschovsky, Michelle M. Mello, Ralph C. Mayrrell, and David Katz

### Physicians' Fears Of Malpractice Lawsuits Are Not Assuaged By Tort Reforms

**Concern about Malpractice Liability:**

- 78% of physicians expressed agreement or strong agreement with the statement that it is becoming increasingly risky to rely on clinical judgment, rather than diagnostic testing...

QUALITY AND SAFETY RESEARCH GROUP Slide 28

### - Effect of Availability Bias and Reflective Reasoning on Diagnostic Accuracy Among Internal Medicine Residents

Phase 1, exposure - evaluate the accuracy of a diagnosis provided for 6 different cases.

Phase 2, nonanalytical diagnosis - diagnose 8 new cases, 4 of which had clinical manifestations similar to 2 of the diseases encountered in phase 1.

Phase 3, reflective diagnosis - reflect on the diagnosis of the 4 cases that could have been influenced by an availability bias in phase 2.

Citation: Mamede JAMA 2010

---

---

---

---

---

---

---

---

## Next Steps

### Technical work

- Advance the science of measuring dx errors
- Provide national estimates of harm
- Pilot test impact of interventions on measures
- Work in interdisciplinary teams

### Adaptive work

- Public discussion about reasonable risk thresholds
- Who decides
- Who pays

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Focus and Execute

---

---

---

---

---
